

## New Immunoassay to Detect Lung Cancer Cells

Filesize: 1.21 MB

### **Reviews**

*Undoubtedly, this is the finest job by any article writer. it had been writtern very perfectly and beneficial. Its been printed in an exceedingly simple way in fact it is only following i finished reading this ebook by which basically modified me, modify the way in my opinion.*

## NEW IMMUNOASSAY TO DETECT LUNG CANCER CELLS

Condition: New. Publisher/Verlag: LAP Lambert Academic Publishing | Multiplex Immunoassay Using F-SERS Dots for the Detection of Bronchioalveolar Stem Cells in Murine Lung | Immunoassays using nanomaterials have been rapidly developed for the analysis of multiple biomolecules. Here, highly sensitive and biocompatible surface enhanced Raman spectroscopy-active nanomaterials have been used for biomolecule analysis in order to overcome intrinsic problems of conventional immunoassays. Fluorescent surface-enhanced Raman spectroscopic dots (F-SERS dots) are composed of silver nanoparticle-embedded silica nanospheres, organic Raman tagging materials, and fluorescent dyes. We successfully applied the F-SERS dots for the detection of three cellular proteins simultaneously expressed in bronchioalveolar stem cells in murine lung, and further analyzed the relative expression ratios of each protein. Quantitative comparisons of multiple protein expression in tissue were first attempted using SERS-encoded nanoprobos. Our results suggested that immunoassays using F-SERS dots offered significant increases in sensitivity and selectivity for multiplex targeting, tracking, and imaging of cellular events in living organism. Such immunoassays may serve as the primary next-generation labeling technologies for the simultaneous analysis of multiple biomolecules. | Format: Paperback | Language/Sprache: english | 52 pp.
