Streambed conductance values were initially selected from published estimates of hydraulic conductivities of silt (Freeze and Cherry, 1979, p. 24). The transient model was divided into eight pumping periods as follows: simulation. A specific yield of 0.15 was used in the half of the aquifer outcrop area nearest its updip limit and was used to simulate unconfined conditions (Stricker, 1983). In all other areas, confined conditions were initially simulated by using a storage coefficient of 0.0003. The value of the selected storage coefficient for confined aquifers is the median value of 21 published values for South Carolina clastic aquifers (Siple, 1967; Zack, 1977; Park, 1980; Aucott and Newcome, 1986). Ground-water withdrawals were estimated from published water-use data, telephone surveys, and site visits. In general, more recent data...
