# Bridgman Crystal Growth of an Alloy with Thermosolutal Convection Under Microgravity Conditions

Filesize: 5.37 MB

Reviews

Unquestionably, this is the very best operate by any author. it had been written extremely flawlessly and beneficial. You can expect to like the way the blogger publish this publication.

BiblioGov. Paperback. Book Condition: New. This item is printed on demand. Paperback. 40 pages. Dimensions: 9.7in. x 7.4in. x 0.1in.The solidification of a dilute alloy (bismuth-tin) under Bridgman crystal growth conditions is investigated. Computations are performed in two dimensions with a uniform grid. The simulation includes the species concentration, temperature and flow fields, as well as conduction in the ampoule. Fully transient simulations have been performed, with no simplifying steady state approximations. Results are obtained under microgravity conditions for pure bismuth, and for Bi-0. 1 at. Sn and Bi-1. 0 at. Sn alloys, and compared with experimental results obtained from crystals grown in the microgravity environment of space. For the Bi-1. 0 at. Sn case the results indicate that a secondary convective cell, driven by solutal gradients, forms near the interface. The magnitude of the velocities in this cell increases with time, causing increasing solute segregation at the solidliquid interface. The concentration-dependence of the melting temperature is incorporated in the model for the Bi-1. 0 at. Sn alloy. Satisfactory correspondence is obtained between the predicted and experimental results in terms of solute concentrations in the solidified crystal. This item ships from La Vergne,TN. Paperback.
