Excerpt from An Ecosystem Analysis of Oil and Gas Development on the Texas-Louisiana Continental Shelf Observed effects of oil and gas development activities and effluents are described. Data from most field studies indicate that direct effects are limited in space, but the effects over time are unknown. One of the major problems has been separating effects of oil and gas development-related activities and other man-induced variations from natural changes. Particular concern is expressed relative to increased organic loading of the system and the apparently related low dissolved oxygen levels characteristic of some parts of the system during warm seasons. It is recommended that future research be directed towards defining key processes governing the ecosystem, with modeling workshops serving as the focus for these research and monitoring programs.
