## SOIL PERMEABILITY DETERMINATIONS FOR USE IN SOIL AND WATER CONSERVATION (CLASSIC REPRINT) (PAPERBACK)

Excerpt from Soil Permeability Determinations for Use in Soil and Water Conservation A knowledge of the rate of movement of water through each significantly different soil horizon has many uses. The amount of water a given soil can transmit during a single rain storm or succession of storms is governed by the permeability of the soil, including its infiltration rate. Runoff is regulated to a great extent by the rate at which water enters the surface soil and percolates to lower depths. In other words, soils which take and transmit water very slowly will give high runoff whenever rains of high intensity and long duration occur. Thus permeability and infiltration data are valuable in over-all planning for irrigation, drainage, erosion control, and flood control.
