EXPERIMENTS WITH TWO METHODS FOR THE STUDY OF VITAMIN B (CLASSIC REPRINT) (PAPERBACK)

Forgotten Books, United States, 2017. Paperback. Condition: New. Language: English . Brand New Book ***** Print on Demand *****. Excerpt from Experiments With Two Methods for the Study of Vitamin B Over 300 quantitative determinations by the gravimetric yeast growth method and over 150 quantitative studies of the growth of young rats have been completed. The data secured with both methods have been such as to permit of the discussion and interpretation of the results upon a quantitative basis. The gravimetric yeast-growth method of Williams seems the most promising of the quick methods permitting easy control of condition throughout an experiment and relatively rapid and numerous repetitions by means of which to reduce the probable error of the mean result. The data obtained make it clear that this method as here described is capable of yielding consistent results, the coefficient of variability and probable error of which can be kept within limits quite satisfactory for the purposes of vitamin research as at present developed. The Williams method is, however, open to the Objection that the increased growth of yeast which it measures may be due to the introduction of other substances favorable to yeast growth as well as the vitamin B. The medium devised by Fulmer, Nelson, and Sherwood to overcome this Objection is not adapted to gravimetric use especially because of its employment of insoluble buffers. The counting of cells yields results too variable for satisfactory quantitative discussion. The rat-growth method involves somewhat larger probable errors than the Williams yeast method, but can be interpreted in terms of the B vitamin with much greater certainty and is therefore the preferable method.
