Excerpt from The Sterilization of Milk and the Status of Our Knowledge Upon the Subject: Read Before the American Medical Association, Washington, May 5, 1891 Milk as it exists in the udder of the healthy cow is devoid of bacteria, as is also that of the human subject germs of an offending nature reach the milk after it has left the animal. Speaking only of healthy animals and their milk, it is a matter of daily observation that various samples of milk will contain varying quantities of foreign matter, due, no doubt, to varying conditions of cleanliness at the first dairies. Soxhlet and Renk called attention first to the palpable detritus to be found in milk, and this has been often confirmed by my own observations. Aside from straw or dirt from the hands, if milk be allowed to stand in large quantities, small black specks may be seen at the bottom of the containing vessel, if this be glass. These small specks are manure from the udder or teats of the animal; thus it is easy to see how even healthy milk may contain very obnoxious elements. Renk found that different dairies varied in this respect as to the quantity of sediment. Here, in New York, I am happy to say, we can, with care, obtain a milk moderately free, though not entirely so, from those elements but I have during the summer season (a year ago) seen these black specks very abundant in milk in large quantities. Thus the bacteriology of milk must vary vastly with the varying amount of care or cleanliness with which the milk is collected, - and results of different authors will also vary, according to...
