

## Regulation of RBP1/BCAA transcriptional repression activities

By Olivier Binda

LAP Lambert Academic Publishing Okt 2013, 2013. Taschenbuch. Book Condition: Neu. 220x150x17 mm. This item is printed on demand - Print on Demand Neuware - RBP1 and BCAA repress transcription in both HDAC-independent (R1) and HDAC-dependent (R2) manners. Like RBP1, BCAA can associate with the mSIN3A/HDAC complex via the SAP30 subunit. The region responsible for this interaction (R2) mediates HDAC-dependent transcriptional repression. The latter is regulated by the NAD<sup>+</sup>-dependent enzymatic activity of the class III histone deacetylase SIRT1, which is recruited to the mSIN3A/HDAC complex via the tumour suppressors ING1b and ING2. The HDAC-independent repression activity of both RBP1 and BCAA is regulated by post-translational modifications. The R1 repression activity can be further dissected into a domain that targets basal transcription (R1 ) and one that represses both basal and activated transcription (R1 ). SUMOylation of the R1 region is essential for its repression activities. SUMOylation of R1 is itself regulated by the overall local amino acids charge. The biological relevance of RBP1 and BCAA transcriptional repression activities is highlighted by their requirement for induction of cell growth arrest and terminal cell cycle withdrawal or cellular senescence. 284 pp. Englisch.

### Reviews

*This publication is great. It really is packed with knowledge and wisdom Your daily life period will probably be transform when you complete reading this article book.*

-- **Wilford Metz**

*A top quality publication along with the typeface applied was exciting to read through. It can be rally interesting through reading through time. Your life period will be enhance once you full reading this article book.*

-- **Prof. Demond McClure**
