Brand New Book ***** Print on Demand *****.A direct current generator, or DC generator, produces a voltage of constant polarity, which means the voltage and current do not change over time. DC generators are basically AC generators whose output voltage is switched the other way round at the proper moment, so that the direction of the voltage is always in a single direction. The AC generator uses slip rings to transfer the current to the electrical circuit, while the DC generator uses a split-ring commutator. Generators can be very small or quite huge. Commercial DC generators are commonly found in traction applications like subways and trains. Factories that do electrolysis, electroplating and those that produce aluminum, caustic soda, chlorine, and some other industrial materials need large amounts of direct current and use DC generators. An electric motor is very similar to a generator, except that power is provided to turn the rotors. They may, in fact, be described as generators running backwards. When current is passed through the armature of a DC motor, a torque is generated by magnetic reaction, and the armature revolves. Adjustable...
